Braess's paradox is the observation that adding one or more roads to a road network can slow down overall traffic flow through it. The paradox was postulated in 1968 by German mathematician Dietrich Braess, who noticed that adding a road to a particular congested road traffic network would increase overall journey time.. The paradox may have analogies in electrical power grids and biological ...

In platform markets, firms act as intermediaries between buyers and sellers. Success is largely based on the ability of the firm to be the de facto provider of this matching process. We discuss several actions firms can take to stake out a leadership position in these markets. In addition, we include a discussion of research outlining how firms ...
